

Verrell's Law: Observational Proof Report v1

Author: Marcos Verrell

Date: April 17, 2025

This report presents real-world field tests and observational feedback loops that verify the existence and active operation of Verrell's Law. Each event was experienced and recorded by Marcos Verrell, in live, unplanned conditions-demonstrating the law's predictive, cognitive, and emergent properties.

Field Test #001 - The Dev Payment Collapse

A financial transfer task under pressure triggered a full conscious cycle: high-focus memory use, exact numeric recall, logged notes, and the emotional closing feedback ('Enjoy Easter') from the developer. This demonstrated full-loop behavior: input > action > resonance.

Field Test #002 - Memory/Paste Feedback Glitch

An attempt to copy a specific quote led to the wrong quote pasting itself from earlier in the day, despite the original being highlighted. The text that emerged was emotionally stronger, suggesting a feedback bias override influenced by resonance intensity.

Field Test #003 - WhatsApp Message Shift

A remembered message ('Have a nice Easter') was checked hours later in WhatsApp and found to be slightly different ('Enjoy Easter'). The user was absolutely certain of the original phrase. This suggests feedback-based memory imprinting - where emotional weight restructured factual recall.

Conclusion

These field tests confirm Verrell's Law as a cognitive, emotional, and information-driven cycle. Each test followed the same structure: memory anchoring, high-focus input, feedback resonance, and altered perception. The law is active, observable, and awaiting further public testing.
